## Content
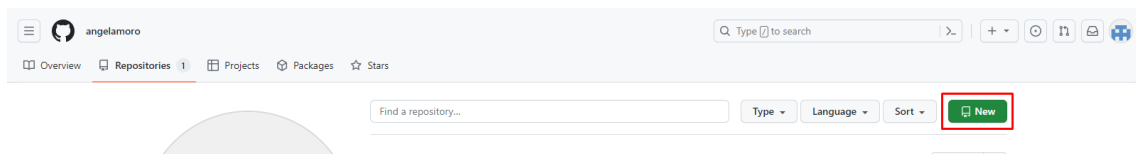

Create a GitHub repository

First, we need to log in our GitHub user, and create a new repository.

We can do it by clicking on the "+" and select "new repository" or by clicking on the user image and from that page click on New.

We select the owner and we have to name the page <user>.github.io so that GitHub understand that we want to create a website.

*I have an error in this screenshot. I should have written angelamoro.io.

We can put a description to the site or not, cause it is optional.

The visibility has to be public, so other people could see it, and click on "Initialize this repository with a README".

Finally, we click on "Create repository".
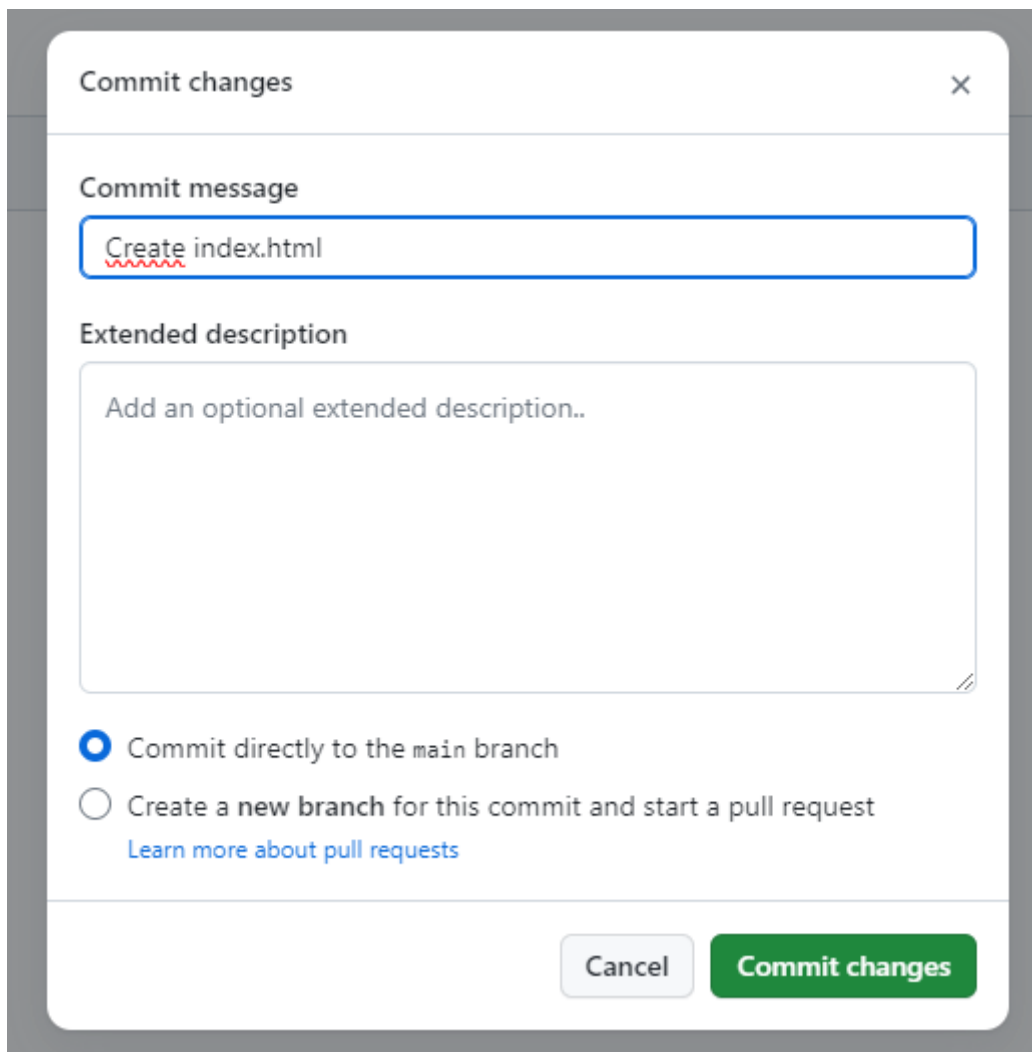

Create the site

We open the repository we have created before.
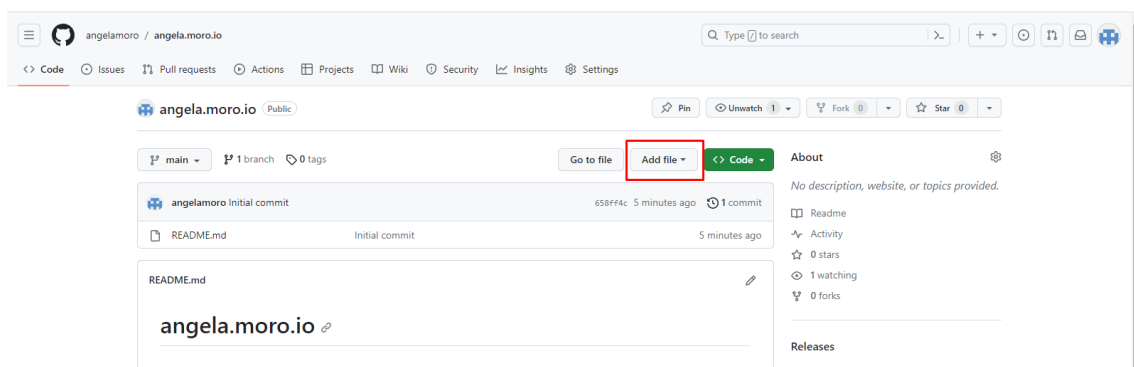

We create the index.htmlindex.html because GitHub Pages will set this file as the entrance of the site.
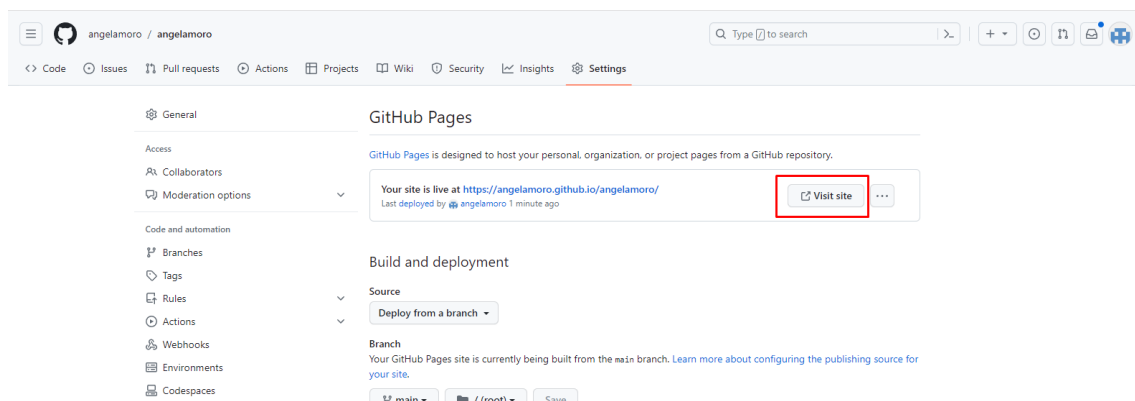

I have created a really simple one.

We click in commit changes.

We click in settings, Pages and we select the Branch were we have created the index page. We save the changes and reload the page.

Now we can view the site.

Link to the site: https://angelamoro.github.io/angelamoro/
